

TESTIMONY OF ROBERT L. FOUGERE

1
2
3 1. Q. Please state your name, business address, and position with respect to the
4
5 petitioning company.

6
7
8 A. My name is Robert L. Fougere. My business address is 55 Bearfoot Road,
9
10 Northborough, Massachusetts. I am a Lead Senior Engineer in the
11
12 Substation Engineering Group for the National Grid Service Company
13
14 (NGSCO), which performs engineering and other services for National
15
16 Grid companies, and includes the petitioning company, New England
17
18 Power Company (NEP). The department I work in is responsible for the
19
20 engineering and project management needs for electrical substations
21
22 within the system.

23
24
25 2. Q. Are you a Registered Professional Engineer in the Commonwealth of
26
27 Massachusetts?

28
29 A. Yes, I am.

30
31
32 3. Q. Will you please outline your qualifications to testify on behalf of New
33
34 England Power Company in this case?

35
36 A. I have a Bachelor of Science degree in Electrical Engineering with a
37
38 concentration in power systems from Northeastern University in Boston,
39
40 Massachusetts. I've worked as a Substation Engineer for NGSCO since
41
42 July 1990. Prior to that, I worked as a Material Engineering Coordinator
43
44 for Stone & Webster Engineering. In this position, I was assigned to
45

1 a nuclear power plant project in Detroit, Michigan. I also worked as
2
3 an Electrician and Nuclear Power Plant Operator in The United States
4
5 Navy for six years. I have held my current position as Lead Senior
6
7 Engineer since April of 2001.
8
9

10 4. Q. What is the purpose of your testimony?
11

12 A. The purpose of my testimony is to provide equipment, structure, and land
13
14 use descriptions that are subject to this exemption request.
15

16
17 5. Q. Have you submitted any exhibits with your testimony?
18

19 A. Yes, the exhibits are marked RLF-1 through RLF-7.
20
21

22 6. Q. Were these exhibits prepared by you or others under your direction?
23

24 A. Yes, they were.
25
26

27 7. Q. Referring to your exhibits, for the purpose of illustration,
28
29 will you describe for the record the proposed additions to the Salem
30
31 Harbor Station Switchyard?
32

33
34 A. NEP's proposal is to install two 115 kV, 63 MVar capacitor banks
35
36 at the Salem Harbor Station Switchyard located at 24 Fort Avenue in
37
38 Salem, Massachusetts. RLF-1 is an aerial photo of the Salem Harbor
39
40 Station. It displays the relationship of the switchyard to Salem Harbor and
41
42 the city itself. RLF-2 is a recent site survey of the station which includes
43
44 the switchyard. This drawing shows the property boundaries, existing
45

1 structures, and other use areas at the site. RLF- 3 is a general layout
2
3 drawing. It illustrates the assets of the generation company (US
4
5 Generating NE, Inc. or “USGen”) and those of NEP, the transmission
6
7 company, the easements obtained by NEP for both substation and
8
9 transmission use, and the proposed additions for the capacitor bank
10
11 installation. It illustrates the 4kV assets of NEP’s affiliated
12
13 distribution company, Massachusetts Electric Company (MECO) as well.
14
15 As you can see from drawing RLF-3, the structures for the new 115 kV
16
17 bay will be of the same dimensions as the existing 115 kV bays (110ft x
18
19 40ft). The structures identified as CAP BANK 1 and CAP BANK 2 on the
20
21 drawing will be located approximately 100 feet northwest of the new fifth
22
23 bay. The dashed lines that connect the two structures represent the
24
25 underground 115 kV cables. In the new bay, we plan to install 115 kV,
26
27 3000 amp circuit breakers and switches and 115kV instrument
28
29 transformers. This equipment will be connected to the 115kV electrical
30
31 buses (1 & 2) and to the new 115kV, 63 MVar capacitor banks via the
32
33 underground cables. The capacitor banks with their associated reactors and
34
35 switches are planned to be installed within the existing USGen parking lot
36
37 in a mutually agreed upon area designated as substation easement
38
39 property. The underground cables needed to connect the capacitor banks
40
41 with the equipment in the fifth bay will be laid in new concrete trenches
42
43 installed at surface grade. Equipment needed to protect, control, and
44
45 monitor the capacitor banks will be installed in the switchyard control

1
2 house. Some of the control cables associated with these functions will be
3
4 installed in separate conduits running parallel to the concrete trenches.
5
6 RLF-4 depicts the electrical schematic one-line for this installation. RLF-5
7
8 and RLF-6 illustrate the physical electrical arrangement of the equipment
9
10 being installed. As you can see by these exhibits, the fifth bay will contain
11
12 two 115 kV circuit breakers with their associated switches, instrument
13
14 transformers, and bus work. These breakers connect to underground cables
15
16 in the middle of the bay. The other end of the underground cables rise up
17
18 in the parking lot near the capacitor banks and connect to their associated
19
20 equipment (switches, instrument transformers, and reactors). The fifth bay
21
22 equipment and structures will require a switchyard fence expansion. The
23
24 new fence section, as it does today, will have a padlocked gate and be
25
26 accessible to authorized personnel only. The capacitor banks and its
27
28 associated equipment will have a separate fenced area (7 – foot chain link
29
30 topped with 3 three barbed wire strands) and padlocked gate for
31
32 authorized persons only. This fencing arrangement complies with the
33
34 requirements of the National Electrical Safety Code (NESC) and National
35
36 Grid Construction Standards.
37

- 38 8. Q. How long do you anticipate the design and construction to take place and
39
40 what hours of construction are planned?
41
42 A. From the final project design through facility commissioning, 20 months
43
44 will be required to complete the project. Construction hours will be
45

1 between 7 am and 5 pm Monday through Friday; however, at times, it may
2
3 be necessary to work outside of these time periods in order to minimize
4
5 critical electrical equipment outages during construction.
6

7 9. Q. Will you please inform the Department as to the construction and
8
9 operational standards to which these facilities are to conform?
10

11 A. These facilities will be built in accordance with the latest standards
12
13 established by the NESC, the American National Standards Institute
14
15 (ANSI), and the Institute of Electrical and Electronic Engineers
16
17 (IEEE).
18
19

20 10. Q. The Department has recently received an exemption request from USGen
21
22 that requires an expansion of the 115 kV switchyard to supply its
23
24 proposed emissions control equipment. This expansion is in the same area
25
26 as you describe. Please describe how NEP's proposed use will affect the
27
28 USGen project.
29

30 A. USGen and NEP have been in discussions over both parties' proposed uses
31
32 for several months. Exhibit RLF-7 is a general layout that depicts NEP's
33
34 proposed use and NEP's current understanding of USGen's proposed use
35
36 superimposed on it. Sufficient space is available for NEP to build its fifth
37
38 115 kV bay and still provide room for USGen's two 115 kV electrical
39
40 supplies. From the last meeting between the parties, USGen will draft a
41
42 memorandum that should describe how the two parties' designs will
43
44 accommodate the two proposed uses. Questions surrounding the location
45

1 of USGen's equipment, gates, and driveways on NEP's substation and/or
2
3 transmission easements still need discussion, but the coexistence of the
4
5 two projects does appear to be technically feasible.
6

7 11. Q. Are you aware of the need for zoning exemptions to accommodate NEP's
8
9 project?
10

11 A. Yes. I have been advised by counsel that portions of the City of Salem
12
13 zoning ordinances may impose a special permit and code exemption
14
15 requirements on NEP for this project.
16

17
18 12. Q. Does this complete your direct testimony?
19

20 A. Yes, it does.
21
22
